Vinny Vinh Quoc Pham

vinnypham11@gmail.com | github.com/vnnphm | linkedin.com/in/vinny-pham | vnnphm.com

Education

De Anza Community College — Cupertino, CA
A.S. Computer Science, Transfer Track — *Sep. 2024 – Expected May 2027*
Associate in Arts for Transfer, Business Administration (AA-T) — *Expected Winter 2026*

Projects

RefundHunter | GitHub | Devpost | *Python, uAgents, ASI:One, Gmail API* — Cal Hacks 13.0, Oct. 2026

- **Best Use of ASI:One Award** – multi-agent assistant that tracks prices of past purchases and flags when users are owed a price-adjustment refund
- Built the coordinator agent (Agent Chat Protocol, Interactive Cards) orchestrating five Agentverse uAgents, plus a parser agent that uses ASI:One's asi1 model to extract line items from receipts and emails
- Integrated Gmail via read-only Google OAuth with no refresh token, revoking access after each import and storing only purchase details

CacheProof | GitHub | *Python, FastAPI, MCP, pgvector* — Beta Fund × Snowflake Hackathon, Aug. 2026

- Built an AST-aware semantic cache for read-only repository tools used by cloud coding agents, hard-scoping every lookup by tenant, repository, commit, permission hash, and tool schema to prevent cached results from crossing trust boundaries
- Reduced median retrieval from 2,973 to 161 tokens (95% smaller) by serving AST-scoped symbol slices instead of full files, and eliminated wrong-symbol cache hits produced by file-level caching on near-duplicate symbols
- Exposed the cache through FastAPI and an MCP stdio server with a fail-closed LLM judge that returned 0 false approvals across 40 adversarial symbol pairs
- Built a deterministic replay harness and dashboard to meter retrieval, embedding, judging, and indexing costs per call, with tests covering scope isolation, commit invalidation, and cache-decision logic

PRDock | GitHub | *TypeScript, Node.js, PostgreSQL, Docker, AWS*

- Built a pull-request preview deployment platform that processes GitHub webhook events, persists deployment state in PostgreSQL, and provisions isolated preview environments for incoming commits
- Implemented an event-driven deployment pipeline using Amazon SQS, ECR, and ECS Fargate to queue deployment jobs, store Docker images, and launch containerized preview applications
- Configured GitHub Actions with AWS OIDC and IAM roles for temporary credential-based authentication, eliminating long-lived AWS access keys from CI/CD
- Designed webhook processing using GitHub delivery IDs and commit-aware deployment records to prevent duplicate work and stale deployments
- Configured ECS task definitions, VPC networking, security groups, CloudWatch logging, and container runtime settings to launch preview applications on AWS Fargate

Experience

IT Technician — May 2020 – Mar. 2025
Lamson Manufacturing

- Repaired and maintained company computers, printers, networking equipment, and office devices
- Provided fast IT support under tight deadlines to keep systems running efficiently

Tea Barista / Team Member — Oct. 2025 – Feb. 2026
Rabbit Rabbit Tea

- Operated POS systems, prepared beverages, and collaborated with team members to maintain efficient workflow

Technical Skills

Languages: C++, Java, JavaScript, TypeScript, Python, HTML/CSS
Frontend: React, Next.js, TanStack Start, Tailwind CSS
Backend: Node.js, Express.js, FastAPI, PostgreSQL, Prisma
Infrastructure: Docker, AWS ECS, Fargate, ECR, SQS, IAM, VPC, CloudWatch, GitHub Actions
Developer Tools: Git, GitHub, AWS SDK, Supabase, Neon, pgvector, Claude Code, Codex, WebStorm, PyCharm, Visual Studio Code
